DETAILED ACTION

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 08/31/06 has been entered. Claims 1-25 are amended for examination.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-12, 14-16, 19-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Justice, Jr. et al (us pat 6,418,469) (hereinafter Justice) in view of Roytman et al (us pat 6,356,282) (hereinafter Roytman).

As regarding claim 1, Justice discloses receiving network management data (col.1, lines 25-39), and determining if the network management data indicates the resolution of a previous event generated by the network management system in response to previously received network management data (col.1, lines 25-67, col.3,

lines 26-67; col.4, lines 1-33, also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous event is just an event in the log); removing said previous event from a memory of the network management system (see Justice col.1, lines 38-39, col.3, lines 57-58, deleting entries from event list, if determine if it is resolved).

Justice does note explicitly disclose changing a severity indicator of said previous event dependent on said determining step; depending on said severity indicator.

Roytman teaches changing a severity indicator (see Roytman col.2, lines 18-33, 59-67 to col.3, lines 5, col.7, lines 1-21, lines 54-67; col.8, lines 1-21, the network manager changing the state of the alarm).

It would have been obvious to one with ordinary skill in the art at the time the invention was made to combine the teaching of Roytman to the method of Justice to change the state of the alarm because by changing the state of the alarm would made it easy to acknowledge the individual alarms and helpful to network management personnel in identifying the cause of the alarm and its solution (see Roytman col.3, lines 31-43, col.7, lines 1-45).

As regarding claim 2, Justice-Roytman discloses if the network management data indicates the resolution of a previous event, the method further comprises marking the previous event as resolved (see Justice, Fig.8, mark date and time of resolved event).

Art Unit: 2152

As regarding claim 3, Justice-Roytman discloses the network management data is processed in response to the network management system receiving network management data from the network (see Justice, col.1, lines 25-67).

As regarding claim 4, Justice-Roytman discloses the network management data comprising values of a monitored characteristic of a part of the network for which an event is generated if the monitored value exceeds a predetermined threshold (see Justice col.3, lines19-67, col.4, lines 1-33; also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous event is just an event in the log), wherein an event list includes an unresolved previous event for the monitored characteristic, wherein the step of receiving network management data comprises receiving a value for the monitored characteristic, and the step of determining comprises considering whether the monitored value has been below the predetermined threshold for a preceding time period, and if so determining that the received value indicates the resolution of the unresolved previous event (see Justice col.3, lines19-67, col.4, lines 1-33; also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous event is just an event in the log).

As regarding claim 5, Justice-Roytman discloses in response to receiving the network management data, comparing a first received value for the monitored characteristic with the predefined threshold, and if the value is below the predefined

Art Unit: 2152

threshold, starting a timer, the timer expiring at the end a predefined time period (see Justice col.3, lines 26-67, col.4, lines 1-33).

As regarding claim 6, Justice-Roytman discloses comparing each subsequent received value for the monitored characteristic with the predefined threshold, and if any value exceeds the threshold canceling the timer (see Justice col.3, lines 26-67, col.4, lines 1-33).

As regarding claim 7, Justice-Roytman discloses when the timer expires, determining that the monitored value has been below the predetermined threshold for the preceding time period (see Justice col.3, lines 26-67, col.4, lines 1-33).

As regarding claim 8, Justice-Roytman discloses periodically receiving a value for the monitored characteristic (see Justice, col.4, lines 19-33); if a received value exceeds a predetermined threshold for the monitored characteristic generating an event (see Justice, col.3, lines 43-67, col.4, lines 1-17); and thereafter, periodically considering whether the monitored value has been below the predetermined threshold for a preceding time period, and if so determining that the event is resolved (see Justice col.3, lines 26-67) and changing a severity indicator of said event (see col.2, lines 18-33, lines 59-67 to col.3, lines 5, col.7, lines 1-21, lines 54-67; col.8, lines 1-21, the network manager changing the state of the alarm); wherein the severity indicator establishes whether the said event should be removed form a memory of the network management system(see Justice col.1, lines 38-39, col.3, lines 57-58, deleting entries from event list, if determine if it is resolved). The same motivation was utilized in claim 1 applied equally well to claim 8.

Art Unit: 2152

As regarding claim 9, Justice-Roytman discloses the preceding time period is an immediately preceding predetermined time period, and the step of periodically considering comprises considering whether the monitored value has been below the predetermined threshold for the immediately preceding time period in response to each subsequently received value (see Justice col.3, lines 19-67, col.4, lines 1-33).

As regarding claim 10, Justice-Roytman discloses the step of considering determines that the event is resolved; the method further comprises marking the event as resolved (see Justice Figure 8, mark the date of the resolved event).

As regarding claim 11, Justice-Roytman discloses the network management data relating to an asynchronous Trap being received by the network management system, wherein the step of determining comprises considering if the Trap indicates the possible resolution of an event in an event log (see Justice, col.3, lines 14-67).

As regarding claim 12, Justice-Roytman discloses if the Trap indicates the possible resolution of an event in an event log, the step of determining further comprises considering whether the event log includes a previously received event that is resolved by the Trap (see Justice col.3, lines 14-67).

As regarding claim 14, Justice-Roytman discloses the method processes network management data previously received by the network management system and stored in memory (see Justice col.3, lines 6-13, database store action list).

As regarding claim 15, Justice-Roytman discloses the step of receiving network management data comprises receiving event data relating to an event stored in

Art Unit: 2152

memory, in response to a scan of previously generated events stored and included in an event log (see Justice, col.2, lines 51-67).

As regarding claim 16, Justice-Roytman discloses the event data relates to a recurring event and includes the time of the last occurrence of the event (see Justice col.2, lines 51-67, Figure.8).

As regarding claim 19, Justice-Roytman discloses A method for processing event data generated by a network management system during the monitoring of a network (see Roytman col.2, lines 18-33, 59-67 to col.3, lines 5, col.7, lines 1-21, lines 54-67; col.8, lines 1-21, monitoring and displaying alarm in the log) the method processing event data relating to events previously generated by the network management system a plurality of times and which may be entered in the event log as a recurring event (see Justice col.1, lines 25-67, col.3, lines 26-67; col.4, lines 1-33, also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous event is just an event in the log, event 11000 appeared three times in the log, also see Figure 8, upgrade system Rom appeared twice with two different time periods), determining if an event has already been logged a predetermined number of times in an event list, and if so identifying a recurring event to be processed from the event list (see Justice col.1, lines 25-67, col.3, lines 26-67; col.4, lines 1-33, also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous

Art Unit: 2152

event is just an event in the log, event 11000 appeared three times in the log, also see Figure.8, upgrade system Rom appeared twice with two different time periods); and considering whether the condition which caused the event to be generated has occurred in a preceding time period (see Justice col.1, lines 25-67, col.3, lines 26-67; col.4, lines 1-33, also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous event is just an event in the log, event 11000 appeared three times in the log, also see Figure.8, upgrade system Rom appeared twice with two different time periods).

As regarding claim 20, Justice-Roytman discloses if the step of considering determines that the condition which caused the event to be generated has not occurred in the preceding time period, determining the event to be resolved (see Justice col.1, lines 25-67, col.3, lines 26-67; col.4, lines 1-33, also see Fig.5, the log represents the list of action and recurring action, determine if the event in the log is resolved, then the management program updates the event list in response to the condition being resolved, the previous event is just an event in the log).

As regarding claim 21, Justice-Roytman discloses mark the event in the event list as resolved (see Roytman col.2, lines 18-33, 59-67 to col.3, lines 5, col.7, lines 1-21, lines 54-67; col.8, lines 1-21, mark the event cleared).

As regarding claim 22, the limitations are similar to claim 1, therefore rejected for the same rationale as claim 1.

Art Unit: 2152

As regarding claims 23-25, the limitations are similar to claims 1-4, therefore rejected for the same rationale as claims 1-4.

Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Justice, Jr. et al (us pat 6418469) (hereinafter Justice) in view of Roytman (us pat 6,356,282) and further in view of Arrowsmith et al (us pat 66,373,383) (hereinafter Arrowsmith).

As regarding claim 13, Justice considering if the Trap indicates the possible resolution of a event in an event log, and if so considering if the Trap indicates the possible resolution of a further event in the event log (see Justice col.3, lines 26-58, the network message Trap indicate the same problem or other problem has occurred, management application identify when a condition has been resolved)

Justice does not specifically disclose receiving a Trap from the network.

Roytman teaches receiving a Trap from the network (see Roytman col.1, lines 55-59; col.5, lines 53-65).

The same motivation was utilized in claim 1 applied equally well to claim 13.

The combination of Justice-Roytman does not teach determining if the received Trap is a reportable condition (see Justice col.3, lines 36-67; col.4, lines 1-33).

Arrowsmith teaches determining if the received Trap is a reportable condition (see arrowsmith col.4, lines 16-27, if the alarms pass the filter criteria, the alarm message is sent to the appropriate network management application).

Art Unit: 2152

It would have been obvious to one with ordinary skill in the art at the time the invention was made to combine the teaching of Arrowsmith to the method of Justice-Roytman to determine if the received trap is a reportable condition because by doing so it would provide great control over which alarm get reported to network management applications and to ensure consistency of reported alarms across multiple network application (see Arrowsmith col.4, lines 65-67 to col.3, lines 1-2).

Claims 17-18, are rejected under 35 U.S.C. 103(a) as being unpatentable over Justice, Jr. et al (us pat 6418469) (hereinafter Justice) in view of Roytman (us pat 6,356,282) as applied to claim 16 above and further in view of Gaffaney et al (us pat 5634008) (hereinafter Gaffaney).

As regarding claim 17, Justice-Roytman discloses all limitations of claim 1, 16 above but does not discloses comparing the present time with the time of the last occurrence of the event, and, if the time difference is greater than a predetermined time interval, determining that the event is resolved. Gaffaney teaches comparing the present time with the time of the last occurrence of the event (col.3, lines 1-12), and, if the time difference is greater than a predetermined time interval, determining that the event is resolved (col.3, lines 1-12).

It would have been obvious to one with ordinary skill in the art at the time of the invention was made to combine the teaching of Gaffaney to the method of Justice-Roytman to have comparing the time of the events, if the time difference is greater than

Art Unit: 2152

a predetermined time interval, determining that the event is resolved for the purpose of eliminating the need for maintenance of multiple timer and for recalculating time intervals in order to determine whether or not prescribed threshold conditions associated with a plurality of events associated with a plurality of devices in communication network have been detected (see Gaffaney col.2, lines 14-29).

As regarding claim 18, Justice-Roytman-Gaffaney discloses the step of determining determines that the event is resolved, the method further comprises marking the recurring event as resolved (see Justice, col.2, lines 51-67, col.3, lines 1-67, also see Fig.8, mark the date and time of the resolved event).

Response to Arguments

Applicant's arguments filed 8/31/06 have been fully considered but they are not persuasive.

As regarding applicant's argument that the prior art does not teach "the removal of an event from memory based on a severity indicator" examiner respectfully disagrees, Justice teaches if deleting the entries from the event list if that entry is resolved (i.e. not critical) (see Justice col.1, lines 38-39, col.3, lines 57-58). Roytman on the other hand discloses changing the severity indicator of the event (see Roytman col.7, lines 54-67, col.8, lines 1-21). It is obvious to one with ordinary skill in the

Art Unit: 2152

networking art would motivated to delete the event, depend on the severity indicator. It is obvious to remove the event if the event is resolved (the severity level is low) because by doing it would make it easier for the network administrator to look through event list and determine which event need to be resolved.

As regard to Applicant's arguments with respect to claim 13 have been considered but are most in view of the new ground(s) of rejection.

As regard to applicant's argument that the prior art does not teach "predetermined number of times in an event list" examiner respectfully disagrees, "predetermined number of times" is just the number of times in the event list. Applicant does not specifically define what is "the predetermined of times" in the specification.

Therefore, "the predetermined of times" is just "the number of times in the event list",

Justice teaches the number of times in the event list (see Justice Fig.5).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Duyen M. Doan whose telephone number is (571) 272-4226. The examiner can normally be reached on 9:30am-6:00pm.
